

DNS Report

Domain Name

wikipedia.org

DNS Purpose

The Domain Name System (DNS) converts the domain name wikipedia.org into an IP address so that users can access the website through a web browser.

Common DNS Records

Record Type	Purpose
A Record	Maps the domain name to an IPv4 address
AAAA Record	Maps the domain name to an IPv6 address.
MX Record	Specifies the mail servers responsible for receiving emails.
NS Record	Identifies the authoritative name servers for the domain.
TXT Record	Stores additional domain-related information, such as verification records and security policies.

Observation

Wikipedia uses multiple DNS servers and a distributed infrastructure to provide reliable and fast access to users worldwide.

URL Breakdown

URL Example

<https://www.wikipedia.org/wiki/OpenAI>

Components

Part	Description
https	Secure protocol
www.wikipedia.org	Domain name
/wiki/OpenAI	Path to the webpage

Analysis

The URL uses HTTPS, which ensures secure communication between the user and the website. The domain identifies Wikipedia, while the path directs users to the OpenAI article page.

Website Architecture Notes

Front-End

- HTML
- CSS
- JavaScript

Back-End

- Media Wiki Software
- Database Servers

Security

- Uses HTTPS encryption
- SSL/TLS certificates
- Secure user authentication

Infrastructure

- Global servers and caching systems
- High availability architecture
- Content Delivery Network (CDN) support

Observation

Wikipedia is designed to handle millions of users daily. Its architecture focuses on reliability, scalability, and fast content delivery.
