

Advanced Search Techniques

Target Company

Zoom Communications

Objective

- Compare the results obtained from different search engines and OSINT tools.
- Identify publicly available information related to the target organization.
- Understand the unique strengths and capabilities of each search platform.
- Analyze and compare the findings from multiple sources.
- Document key observations, differences, and security-related insights

Tools Used

Tool	Purpose
Google Search	Used to discover websites, documents, support pages, and other publicly indexed information using advanced search operators.
Bing Search	Used to compare search results, identify additional indexed pages, and discover content that may not appear in Google Search.
Shodan	Used to identify publicly accessible internet-connected assets, including IP addresses, SSL certificates, open services, and hosting information.

Google Investigation

Queries Used

site: zoom.us

site: zoom.us filetype: pdf

site: zoom.us inurl: login

Findings

- Official Zoom website
- Support documentation
- PDF documents
- Privacy policy
- Help Center
- Developer resources

Bing Investigation

Queries Used

site: zoom.us

site: zoom.us filetype: pdf

site: zoom.us inurl: login

Findings

- Official website
- Public PDF documents
- Microsoft indexed pages
- Cached search results
- News articles
- Support resources

Shodan Investigation

Search Used

hostname: zoom.us

Findings

- Public IP addresses

- SSL certificate information
- Hosting provider details
- Internet-facing services
- Network information
- Public service banners

Security Observations

- Public documents should be reviewed regularly.
- Login portals should be protected with strong authentication.
- Public infrastructure should be monitored.
- SSL certificates should be kept updated.
- Sensitive information should never be publicly exposed.

Best Practices

- Monitor publicly indexed content.
- Remove unnecessary public files.
- Secure administrative portals.
- Conduct regular OSINT assessments.
- Review digital footprint periodically.

Conclusion

- Google provides comprehensive web search capabilities and is effective for discovering documents, support pages, and indexed content.
- Bing complements Google by surfacing additional indexed or cached pages that may not appear in Google results.
- Shodan focuses on publicly visible internet infrastructure such as IP addresses, SSL certificates, and exposed services rather than web content.
- Comparing multiple search engines and OSINT tools gives a broader understanding of an organization's public digital footprint.
- Using multiple sources together improves the quality of OSINT investigations while relying only on publicly available information
